4 Network Configuration

4.1 VLANs Configuration on Switch

The RCS environment requires 5 VLANs on a switch.

These VLANs create different logical LAN for each RCS component and for devices management.

On the switch you can create there VLANs:

- Backend VLAN
- Collector VLAN
- Console VLAN
- Firewall Management VLAN
- Switch Management VLAN

The assigned ports on the switch for each VLAN could be 2 or more, depending on the architecture.
4.2 Firewall → Switch Interconnection

The firewall is used to regulate communication between VLANs.

Five zones are configured on the firewall:

- Backend VLAN
- Collector VLAN
- Console VLAN
- Firewall Management VLAN
- External VLAN (Internet)

Zones on the firewall and VLANs on the switch must be connected according to the picture below.
4.3 Hardware Interconnection Schema
Following is represented the whole system architecture with its interconnections. As described in the picture, final infrastructure may include additional RCS Collectors and RCS Shards.
### 4.4 Firewall Rules Setup

The following rules must be implemented on the firewall to allow RCS works correctly.

Table’s colors reflect the colors used in previous pictures.
