

Have a look at the new features.

We are introducing a set of new features in the upcoming releases of Remote Control System, ranging from a further improvement in overall security to support for many new social applications. As always, we are looking to improve our software to provide you with the absolute best tool for your investigations.

Protect your operations

At the beginning of the year we introduced major changes in the security architecture of Remote Control System to face the increase of attention in the community, due to the large adoption of our system.

We **rehailed the architecture and procedures** to reach a new level of security. As a result many technological and procedural changes are introduced that vastly improve over the previous standard.

We won't stop here: there is much more to come to protect you better during your operations.

Resist to disk format

Taking advantage of modern hardware, your Agents now resist to disk format and factory restoration.

Contrary to other technologies, RCS is capable to **resist to everything**:

- disk replacement

- disk format
- OS reinstallation
- factory reset

Capture Telegram

Following the recent NSA scandal, many users switched from the traditional chat applications to an allegedly more secure one, Telegram.

Don't miss the bits that make the difference in your investigations, **capture Telegram chat** and continue following your targets communications.

Get Viber & Skype calls

We are aware that nowadays a significant amount of calls are made using social applications.

Now you can **capture Viber and Skype calls on mobile devices**.

Track crypto-currencies

The usage of crypto-currencies for criminal purposes is increasing dramatically, thanks to the fact that they are designed to prevent the reconstruction of transactions.

Now you can **track all the transactions** that your targets make using BitCoin and other currencies.
